# Tasko: What Really Drives Growth Before the Series A?

Growth Modeling & Data-Driven Strategy

**Groupe 15**

Joe El-Hajj · Colomban Boisseau · Mouad Chouki · Maxime Philippon

IMT Atlantique

2026 – 2027

Does Tasko's growth truly come from the product (PLG), or from paid search?

18 months of production data (Jan 2025 – Jun 2026) ·
9,931 clean workspaces · 47,287 users · 4,402 invoices

# Answer to the board: growth is product-led *after* the sign-up

**×2.5**

Conversion jump once a **team of 3** is formed within 30 days (13.8 % vs 5.6 %)

**1 in 5**

New workspaces in June 2026 come from the **guest invite loop** (19.8 %, zero CAC)

**1.16**

Paid search **LTV : CAC** on revenue (31.5-month payback) vs **2.86** for Content SEO

## Data cleaning & definitions

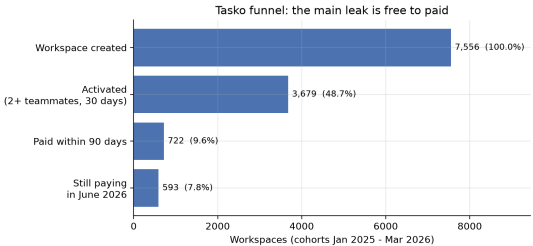

- **7 cleaning rules modified data**: 1 internal account (140 users) & 496 duplicates removed, 859 size labels harmonised, 956 dates converted, 25 MRR sign errors fixed.
- **Activation**: 2+ teammates join within 30 days (team of 3).
- **Conversion**: paid within 90 days (*mature cohorts* up to Mar 2026).

## Strategic diagnosis before Series A

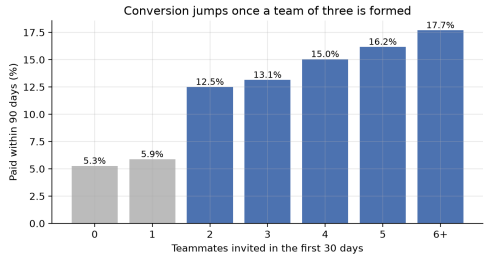

- **Sep 2025 onboarding change** was the pivotal event (+20 pts activation, +2.7 pts conversion; the guest-loop rate also rose 20 % over the whole stock, mechanism unidentified).
- **2027 MRR (42 to 109 k €)** is decided by activation & team size, not ad spend (+20 % paid search budget → only +3.3 % MRR).

# The main leak is free-to-paid, and activation controls it

## AARRR Funnel (mature cohorts Jan 2025 – Mar 2026)

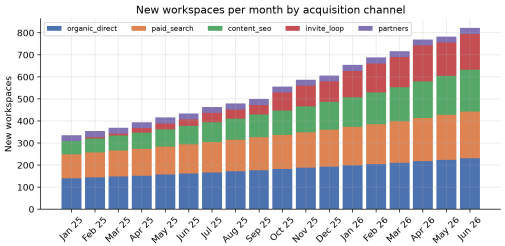

## Aha moment: conversion jumps at 2+ teammates

**Key takeaway:** Activated workspaces (48.7 % of sign-ups) convert at **13.8 % vs 5.6 %** and generate **70 % of all paying customers**. Once paying, 82 % stay.

# A real guest loop that compounds with the base, but $K \ll 1$

## New workspaces per month by channel

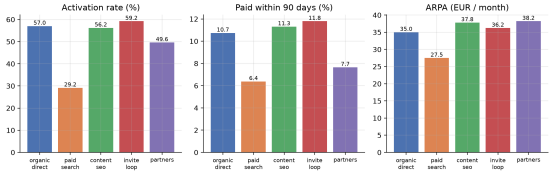

## Monthly loop rate & 180-day effective $K$-factor

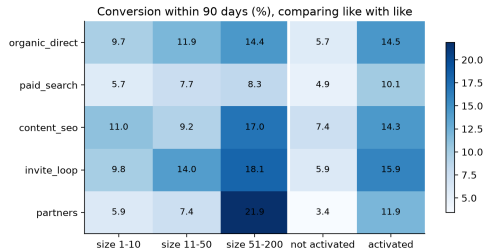

**Key takeaway:** `invite_loop` rises from **0 % to 19.8 %** of acquisition. With $K_{180d}$ rising from **0.09 to 0.12** (median lag 146 days), the loop multiplies acquisition rather than replacing it, fed by the total stock of workspaces, independently of activation or channel.

# Paid search converts less, even like for like

## Raw channel performance: activation, conversion, ARPA

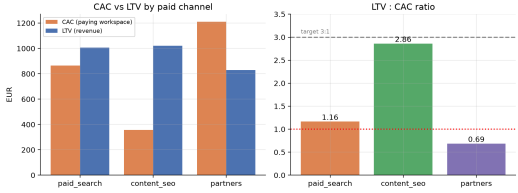

## 90-day conversion (%) within size & activation

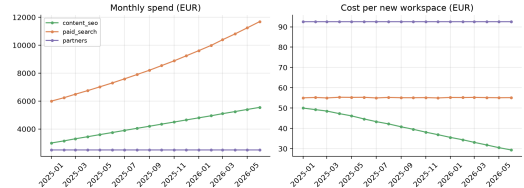

**Key takeaway:** Same size mix across channels (60/29/9 %), yet **among activated teams** paid search converts at **10.1 % vs 14.3–15.9 %**. Its one edge is **retention** (lowest churn, 2.7 %). Segment driver: 51–200 companies bring **66 € ARPA & 1.2 % churn** (vs 21 € & 4.4 %).

# Unit economics: similar LTV, but paid search costs 2.4× more per payer

## CAC vs revenue LTV and LTV : CAC ratio

## Monthly spend and cost per sign-up (CPS)

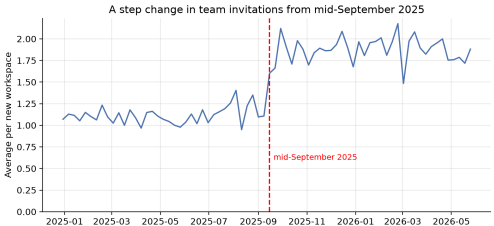

| Paid Channel | CPS | Paying CAC | ARPA | Monthly Churn | Revenue LTV | LTV : CAC / Payback |
|---|---|---|---|---|---|---|
| **Content SEO** | 40 € (50 → 29 €) | 357 € | 37.8 € | 3.7 % | 1,022 € | **2.86 / 9.5 months** |
| **Paid search** | 55 € (flat, spend ×1.95) | 864 € | 27.5 € | 2.7 % | 1,007 € | **1.16 / 31.5 months** |
| **Partners** | 93 € (flat 27 sign-ups/m) | 1,210 € | 38.2 € | 4.6 % | 830 € | **0.69 / 31.7 months** |

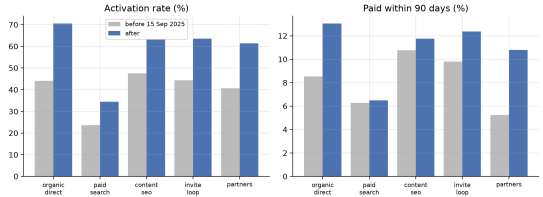

**Key takeaway:** Paid search retains best (2.7 % churn), so its LTV (1,007 €) matches Content SEO's: the whole gap comes from **CAC (864 € vs 357 €)**.

# Mid-September 2025: the onboarding step change

## First-week invitations jump from 1.1 to 1.9

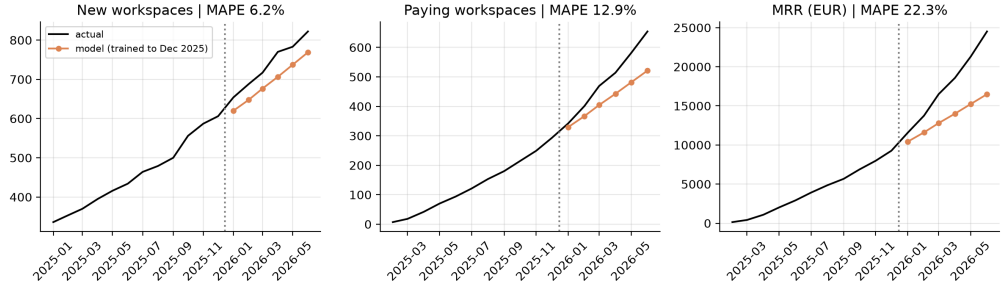

## Activation & conversion before vs after 15 Sep 2025

**Key takeaway:** Permanent product shift: **loop** $K_{180d}$ 0.086 → 0.123 (whole stock, not activation-specific), with **churn unchanged** (3.2 % vs 3.3 %). Exception: **paid search conversion stayed flat** (6.3 % → 6.5 %).

# Backtest: the model reveals where the business changed

## Out-of-sample backtest: calibrated up to 31 Dec 2025, simulated on Jan – Jun 2026

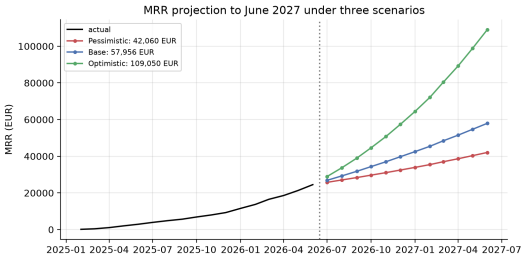

**Model structure:** New $\mathrm{WS}_t = \sum \frac{\mathrm{Spend}_{c,t}}{\mathrm{CPS}_c} + \mathrm{Org}_t + r_{\mathrm{loop}}\mathrm{Stock}_{t-1}$
1–4 month billing lag $\rightarrow$ $\mathrm{Paying}_t$ (churn decay) $\rightarrow$ $\mathrm{MRR}_t = \mathrm{Paying}_t \times \mathrm{ARPA}_t$.

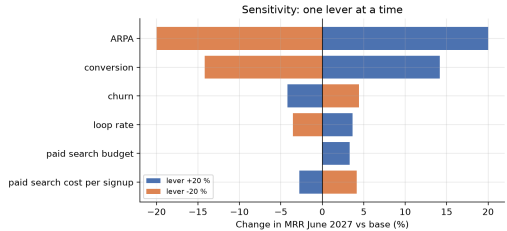

**Error decomposition:** In Dec 2025, Sep cohorts were just turning mature.
+ Post-change conversion: Paying MAPE **12.9 %** $\rightarrow$ **4.0 %**.
+ Observed H1 2026 ARPA: MRR MAPE **22.3 %** $\rightarrow$ **6.2 %**.

# June 2027 projections (42 to 109 k € MRR): post-signup levers dominate

## Three empirical scenarios (Jul 2026 – Jun 2027)

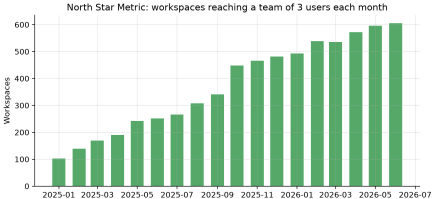

## Sensitivity of June 2027 MRR to ±20 % lever shifts

**Key takeaway:** New workspaces barely differ across scenarios (12.5 k to 13.5 k). Lifting **ARPA (+20 %)** or **conversion (+14.2 %)** drives massive MRR gains, whereas **+20 % paid search budget adds only +3.3 % MRR**.

# North Star Metric, A/B test plan & strategic roadmap

## NSM: Workspaces reaching a team of 3 / month

**Why this NSM (605/m in Jun 2026):** captures team value, predicts conversion ($\times 2.5$) & ARPA, less sensitive to paid search volume. **Guardrails:** 90d conversion & churn.

## A/B Test: Fixing Paid Search Onboarding

- **Treatment:** Optional *"Invite 2 teammates"* step before 1st project (50/50 split on `paid_search`, no dark patterns).
- **Metrics:** Primary = 30d activation (34.5 %); Secondary = 90d conversion (6.5 %).
- **Sizing ($\alpha = 5$ %, power 80 %): +8 pts MDE $\rightarrow$ 577/arm ($\approx$ 5.7 months).**

## 4 Recommendations before Series A

1. **Steer on the Team of 3 NSM** across product & marketing.
2. **Cap paid search** until A/B test proves conversion; **shift growth to Content SEO** (LTV : CAC 2.86, 9.5m payback).
3. **Stop or renegotiate Partners** (LTV : CAC 0.69) per activated team.
4. **Prioritise seat expansion & Business plan** (1.2–2.1 % churn, 66 € ARPA).
